## **Author contributions**

T.-P.C. developed the methodology for generating whole-genome annotation tracks for diverse DNA shape features, designed and developed the GBshape database and its extendable high-throughput prediction platform, and analyzed transcription start sites. L.Y. analyzed nucleosome-binding sites and provided advice in the initial stage of the database development. T.Z. developed the high-throughput method for DNA shape predictions. S.C.J.P. and T.D.T. developed the methodology for hydroxyl radical cleavage annotations, developed the ORChID database, and provided the modENCODE data for nucleosome-bound sequences. B.J.M. and S.V.N. derived the methodology for TSS calling and provided the *Drosophila* TSS sequence data. T.-P.C. and R.R. wrote the manuscript with input from all authors. R.R. conceived, designed, and supervised the project.
